

Selecting Initial Breeding Sources for Morning Varieties from The Potato Variety Sample Collection

Sirojiddin Turdikulovich Jurayev
Doctor of Biological Sciences, Professor
Tashkent State Agrarian University

Rasul Abdujabborovich Karimov
Graduate Student of Tashkent State Agrarian University

Abstract:

Abstract: the article talks about the method of selection of initial selection resources for early varieties from the collection of potato variety samples.

Keywords: Potatoes, potato crops, variety, sample, collection, selection.

Introduction

Now potatoes are sold in 138 countries of the world, 20-22 million. Planted per hectare, 320-335 mln. tons of gross crops are grown. Countries with developed potato production are China (72 million tons), Russia (35.7 million tons), India (26.3 million tons), Ukraine (19.1 million tons), USA (17.7 million tons), Germany (11.6 million tons), Poland (11.2 million tons), Belarus (8.5 million tons), the Netherlands (7.2 million tons), France (6.3 million tons). The average yield is 15-17 t/ha worldwide.

The average yield of potatoes in the world is 18 tons per hectare, and the annual production per capita is 34.2 kg. 50-60% of the produced crop is used for food, 25% as fodder and about 10% as seed (FAO). Providing farms with quality seed materials, creating new ways to save potato seeds are important problems in all potato-growing countries.

Research Results

Experiments will be conducted in 2022-2023 at the experimental sites of the Scientific Research Institute of Vegetables, Rice Crops and Potatoes.

The subject of the research is the study of the high-yielding and early varieties of potatoes and their planting in different periods.

Before planting, potato collection samples were placed in a special room with a temperature of +14-18 C and air humidity of 70-80% for germination (harvesting), and after the day of harvesting, they were germinated in quality in 20-25 days.

Dutch Kronos, Picasso, Evolution, Royal, Sante, Arizona, Manitou, Curado, Saviola, Arielle, Red scarlet German Smena, Adretta, Gala, Russian Kronos, Romantika, Mikado, Red violet Sineglazka, Hungarian Botont, Balatoni rossa, White, Demon , Balatoni sarga Dizere of France, Spunta of China #01, #02, #05, #9, #12 and local varieties Umid-2, Kuvonch 1656, Tashkent-65, Sarnav, Pskom; In the experimental field of Bogizagon

varieties, samples of each variety were planted in a 70×25 cm scheme in 2 rows of 5 m length on March 4 in an experimental field that was prepared in advance.

In the experimental version, 36 samples of varieties were planted. In the collection of planted potatoes, phenological observation and biometric measurements were carried out on variety samples. After planting every 10 cultivars, a local cultivar Pskom was planted as a control cultivar. Kronos, Picasso, Evolution, Umid-2, Red bullet, Romantika, Mikado, Royal, Folva, Smega varieties were compared with the control variety in the first ten. 10% of the control Pskom variety germinated in 14 days, 75% germinated in 20 days, while Evolution, Red Bullet, Romantika, Mikado, Simega, Arizona varieties germinated 1-2 days earlier than the control variant (Table 1).

1-table Results of phenological observation of potato collection samples (2023)

№	Kinds of examples	Germination of seedlings, day		From germination to ..., days

35	№009	14	22	23	25	33	33
36	№012	15	22	25	26	33	35
	Pskom(st)	15	23	26	29	36	39

When studying the number of plant stems in these 10 varieties, the number of stems in Kronos, Picasso, Evolution, Red bullet, Romantika, and Mikado varieties is 0.2 more than the control variety; 0.3; 0.5; 0.2; It was found to be 0.7 times more.

In the next 20 varieties, Dizere, Sante, Arizona, Manitou, Kuvonch, Spunta, Auretta, Gala, Curado, Saviolla were tested in comparison with the control Pskom variety. It took 14-20 days for 10-75% germination of potato seedlings in the control Pskom variety, while Dizere, Arizona, Spunta, Gala, Kurodo varieties germinated 1-2 days earlier than the control option. Germination of Auretta Manitou, Kuvonch 1656 varieties was equal to the control option. In the next 30, Sneglazka, Arielle, Red scarlet, Tashkent-65, Sarnav, Botont, Balatoni rossa, White, Demon, Balatonni sarga varieties were compared with the Pskom variety.

It took 13-21 days for 10-75% germination of potato seedlings in the control Pskom variety, while Sneglazka, Tashkent-65, Botont, Balatoni rossa, White, Demon, Balatonni sarga varieties germinated 1-2 days earlier than the control option. Also, it was found that the weight and productivity of these varieties were higher than the control variant by 47.9 to 63.6 percent. (Table 2)

2-table Results of biometric measurements on potato samples planted as a gene pool (2023)

№	Variety samples	During the flowering period of the plant		Crop in one bush, g	Productivity, t/h	Relative to control, %
		number of stalks, pcs	stem height, cm

32	№001	3,2	48,5	380,0	21,2	158,2
33	№002	3,1	50,5	360,0	20,1	150,0
34	№005	3,5	56,5	370,0	20,7	154,5
35	№009	3,2	50,4	320,0	17,9	133,6
36	№012	3,3	51,2	380,0	21,2	158,2
	Pskom(st)	2,8	43,3	240,0	13,4	100,0

Potato germination of Sarnav, Red scarlet varieties was equal to the control option.

When the samples of Bozhigaon, No. 01, No. 02, No. 05, No. 9, No. 12 were compared with the Pskom variety, it took 15-23 days for 10-75% germination of potato seedlings in the Control Pskom variety. China lines #01, #02, #05, #9, #12 germinated 1-2 days earlier than the control variant. If the number of stems is 0.1 to 0.5 more, and the height of the stem is higher than 5.2 to 13.3 cm, the total yield is 58.2 than the control PSkom variety; 50.0; 54.5; 33.5; It was 58.2% higher than the control option, which was reflected in the experiments.

Conclusion

- In order to preserve the variety samples of the potato collection as a gene pool, 36 varieties of potatoes were planted and studied in the conditions of the Tashkent region in early spring.
- According to the results of the study, when compared with the local Pskom variety of potatoes, Evolution, Red bullet, Romantika, Mikado, Simega, Arizona, Dizere, Arizona,

Spunta, Gala, Kurodo, Sneglazka, Tashkent-65, Botont, Balatoni rossa, White , Demon, Balaton sarga and Chinese lines No. 01, No. 02, No. 05, No. 9, No. 12, sprouting, budding, and flowering were 1-3 days earlier than the control variant, the number of stalks and the yield of stalks were also controlled. 40-50% higher performance than the alternative was found in the experiments.
