

# METHODOLOGY OF TEACHING MILITARY SCIENCES

Khodjikhodjayev Farkhod Makhmudjonovich,  
Academy of the Armed Forces of the Republic of Uzbekistan  
Teacher of the General Tactics Department,  
Doctor of Philosophy in History (PhD), Lieutenant Colonel

## Abstract

The methodology of teaching military sciences is one of the important aspects of the military education system and includes methods, methods and principles aimed at the effective organization of the educational process and the development of military knowledge and skills of students. The teaching process should be aimed not only at imparting theoretical knowledge, but also at forming practical skills. This is important for improving students' readiness for military service.

**Keywords:** Military sciences, methodology, individual characteristics, methodological approaches, practical training, military service.

## Introduction

There are various methodological approaches in the process of teaching military sciences. Teachers need to take into account the individual characteristics, needs and interests of students. Students' psychological state, motivation, and attitude to teaching methods are among the factors that determine the success of the teaching process. Therefore, it is very useful to use interactive methods in teaching military sciences. Interactive methods ensure active participation of students and make the learning process interesting. Along with theoretical knowledge, it is necessary to develop practical skills in the educational process. Military science should generally be practical. It is important to familiarize students with military equipment, weapons and their principles of operation, as well as conduct practical training in the process of learning military tactics and strategies. Such exercises allow students to apply their knowledge in practice and prepare them for real military situations.[1]

The use of modern technologies in the teaching process is also important. Multimedia tools, interactive presentations, simulation programs and virtual reality technologies increase the interest of students and make the teaching process more effective. With the help of such technologies, students will have the opportunity to strengthen their knowledge and develop practical skills. For example, simulation programs allow students to study and prepare for various military situations. Cooperation of students is also very important in the teaching of military sciences. Through group work, discussions, and team projects, students learn from each other, share ideas, and develop collaborative problem-solving skills. This increases students' ability to work in a team and prepares them to be successful in the military service in the future. The interaction of students also develops their social skills, which are important in

military service. It is also necessary for teachers to constantly update their knowledge and skills. The methodology of teaching military sciences must be constantly updated, because the military field is changing rapidly. Teachers need to learn new methods, technologies and pedagogical approaches, as well as share their experiences with others. This, in turn, helps to increase the effectiveness of the educational process.[2]

The assessment system also plays an important role in the teaching process. It helps to evaluate the knowledge and skills of students, determine their level of mastery and optimize the teaching process. The evaluation process should include not only theoretical knowledge, but also practical skills. This also helps to develop students' ability to self-assess. In the process of evaluating students, various methods can be used, for example, tests, practical exams, evaluation of project work and other methods.[3]

The personal development of students is also important in the teaching of military sciences. During the training process, it is necessary to form students' sense of ethics, moral values and responsibility for military service. This, in turn, will have a positive effect on their future military activities. In preparing students for military service, it is necessary to develop their personal qualities, sense of responsibility, leadership skills and teamwork skills. The role of teachers in the teaching process is very important. Teachers are important in conveying their knowledge and skills to students, motivating them and organizing the educational process. [4] Teachers should not only teach their students, but also help them in their personal development. Teachers need to help their students build self-confidence, support them, and achieve their goals.[5]

### Conclusion:

In conclusion, the methodology of teaching military sciences is important in increasing the effectiveness of the educational process, developing the knowledge and skills of students, as well as preparing them for military service. It is necessary to use modern methods, technologies and approaches in the teaching process, take into account the individual needs of students and provide them with practical skills. This, in turn, will help students succeed in their future military careers. The methodology of teaching military subjects must be constantly updated, because the military field is changing rapidly, and teachers need to constantly acquire new knowledge and skills.
