Abstract

The article discusses the important aspects of achieving the quality and effectiveness of education. In the modern educational process, student activity and its success are considered the most important result, and in order to achieve the intended goal, the educational process must be effectively organized. This requires great skill and intellectual intelligence from the teacher. In this sense, this article presents proposals and recommendations regarding the success of the student in education and his role in the development of students' educational activities.

Keywords: Education, education system, technology, success, academic success, quality education.

Introduction

Worldwide on the issues of educational success of teachers and students of higher educational institutions. These scientific studies are organized not only on the basis of pedagogical research, but also on the basis of a number of disciplines, and the importance of integrative research is increasing. The rapid movement of innovations in various fields of science, economics, as well as the international scale of the globalization process, along with the main tasks of modernizing the education system and adapting it based on individual capabilities, establishes the basis for the formation and development of independence and initiative in students, which is determined by their success in the educational environment, and at the same time justifies the need to develop students' academic activities.

The main part of the reforms being implemented in the education sector, of course, are reforms in the higher education system. In particular, determining the priority areas of systemic reform of higher education in the Republic of Uzbekistan, raising the process of training highly qualified personnel with independent thinking to a qualitatively new level, modernizing higher education, and developing the social sphere and economic sectors based on advanced educational technologies are considered one of the main goals of society.

Education is the acquisition of skills and knowledge. It also means helping people learn how to do a task and to think about what they have learned. It is also important for educators to teach how to find and use information. Education needs research to determine how to improve it[5].

The educated and successful individual and the issues of raising such an individual span the period from the distant past to the present day. In particular, Abu Nasr al-Farabi (873-950) said, “Human intelligence is naturally prepared at birth (in the child’s brain) to perceive mental concepts (knowledge about the world). However, the ability to perceive is different in different people. Or, if people do not have the ability to perceive mental concepts, some do not use these capabilities.”[3] From these thoughts of al-Farabi, it can be understood that people living in society have different abilities in some sense, but there must be a sufficient environment for them to be able to manifest them in the outside world.

Let us pay attention to the following story about a man of high virtue by Jalaluddin Rumi (1207-1273), one of the great figures of world literature :

I saw the end before I knew it,

Ask for another place, please [6] ...

From this poetic example, it can be understood that in order for a person to achieve greatness, it is important to be able to assess the future of a thing or event from its current state, that is, to be able to see the future, understand it, think far ahead, think creatively, and think broadly.

The great Amir Temur (1336-1405) wrote, “... from my experience, I used to conduct all my affairs with a council and take the right measures to complete them. Before starting a task, I would plan ways to get rid of it. I would bring it to the end with the right measures, firm determination, sincerity and patience, carefully looking ahead and thinking about the future”[4]. It is clear from these profound thoughts of Amir Temur that he contributed not only to the development of political and economic, but also science and enlightenment in state administration. He supported representatives of this field in every way, created the necessary conditions and opportunities for their creativity, and as a result, the country developed to an unprecedented level.

Indeed, through education, knowledge about society, the country and the world is passed on from generation to generation. Education is the process of imparting knowledge, forming qualifications and skills, the main means of preparing a person for life and work. In the process of education, information is received and upbringing is carried out. Education in a narrow sense means the concept of teaching, but it refers not only to the process of teaching in various types of educational institutions, but also to the process of providing information in the family, production and other spheres[8].

The content and essence of education are determined by the level of material and cultural development of society. The essence, methods, and organizational forms of education have changed at different stages of the development of human society, depending on social relations, the need for general knowledge, the professional training of people, and pedagogical ideas about education.

The purpose of education is to “promote student achievement and prepare them for global competitiveness by promoting excellence in education and ensuring equitable access”[9].

Education provides people with the knowledge and skills that will help them become successful members of society and grow into good and successful individuals. To realize this idea, it is necessary to establish good relationships between learners, teachers and parents. Due to the

influence of the environment , students have the opportunity to develop their full potential, talents and achieve their life goals.

This applies to every level of education, from elementary school to high school, professional and higher education.

Education is considered the greatest helper in helping young people become full members of society. Knowledge, in turn, creates the basis for a successful career, a high social status, a decent life, and the achievement of one's ambitions. To achieve such a high level, great strength and desire are required. An educated person must learn and develop throughout their life, so that they can recognize and take advantage of the many opportunities that lie before them.

Regardless of how one views the purpose of education, the truth is that success in life is impossible without specialized knowledge. Such knowledge is acquired in school and expanded through higher education, and also includes personal development outside the regular education system.

Quality education allows an individual to develop various necessary skills, which increases their chances of finding a better job, advancing in their career, and receiving various benefits, such as:

High social status. High social status is achieved through outstanding achievement in one's chosen profession. Prestigious degrees and advanced training allow highly educated individuals to occupy influential positions in society. Although this is not the ultimate goal of education, high socioeconomic status is closely related to career success, especially in the case of individuals with extraordinary talents (such as artists and scientists) who have left a significant mark on society.

A decent life. Education direction choice in the process the most important education how opportunities Education purpose , others as a row , worthy to life has is to be , this the following own inside receives : financial independence ; travel ; family and personal favorite exercises for enough empty time ; professional fulfillment feeling ; health storage safety .

The opportunity to achieve one's ambitions. Everyone has ambitions, but only those who put a lot of effort into their personal development can expect their plans to come true. Education is the shortest and safest way to achieve this goal, as it provides a systematic approach to obtaining the necessary knowledge in a particular field. It is important to note that education is not only about sitting in a classroom, but also about acquiring various skills , for example, social skills.

Success and the realization of life plans come with the acquisition and continuous development of skills learned over the years and needed in a professional environment.

Acquiring positive skills and habits. Education not only helps to raise knowledgeable young people, but also to adopt good habits that are the key to a positive approach in all areas of life. Education is the study of various subjects to gain deeper knowledge and understanding that can be applied in daily life. Education is not limited to knowledge obtained from books, but can also be gained through practical experiences outside the classroom.

In today's society, an individual's education and knowledge acquisition are an important part of their social acceptance. Education makes them useful members of modern society, and serves as a key factor in their future aspirations and professional development.
